CROSS BORDER RIVER BASIN MANAGEMENT

Pictures: Flood of the Rur in the border region | Rur dam in the upstream region | International river basin of the Rur

## → Flood risk assessment

In Nordrhein-Westfalia/Germany the PFRA is based on the existing 'Hochwasseraktionsplan' or simplified hydraulics. In Limburg/The Netherlands areas at risk are presently identified.

## → Cross border cooperation

The German LAWA method will be used for the Limburg part of the Rur. The river Rur is considered at risk, because the German part upstream is at risk (so-called 'upstream rule').

## → Recommendations

The LAWA method (including the 'upstream rule') is a suitable approach; national differences of the significance criteria have to be considered.
